Finding a Safe Route

Planning a walk that avoids recent incident hotspots

Help Centre User Guide

What the Safe Route planner does

Safe Route calculates two walking routes between any two points on campus: the **shortest direct route**, and a **recommended safer route** that steers around places with recent incident activity, preferring lit and busier paths. You can compare the two before you set off.

Planning a route

1. Click **Safe Route** in the navigation bar.
2. Pick your **From (departure)** location in the first dropdown — for example your residence or the library.
3. Pick your **To (destination)** location in the second dropdown.
4. Alternatively, click directly on the campus map to drop a custom **Start (A)** pin and a **Destination (B)** pin anywhere.
5. Click the find route button. Both routes are drawn on the map in different colours.

Reading the results

Two comparison cards appear above the map:

Card	What it shows
Recommended Safer Route	Distance, estimated walking time and a risk note. This route avoids recent incident hotspots even if it is slightly longer.
Shortest Direct Route	The direct geometric path with no risk weighting — quickest, but it may pass through areas with recent activity.

The map also shows a heat overlay of recent incidents, so you can see *why* the safer route bends away from certain areas.

Tip: At night, the few extra minutes of the safer route are usually worth it. The risk weighting is based on real reports from the last period, so routes improve as students keep reporting.

Good to know: Walking with friends, keeping to lit paths, and letting someone know when you leave are still the best safety tools — Safe Route works alongside them, not instead of them.
