CAMPUSSAFE TWIN | CAMPUS SAFETY PORTAL

Security Officer Guide

The live map, dispatches, hotspots and flagged zones for field staff

Help Centre User Guide

Your tools at a glance

Page	What you use it for
Security Map	Live view of incidents, SOS alerts and the incident heat layer across campus.
My Dispatches	Jobs assigned to you, with status updates from pending through resolved.
Patrol Hotspots	Grid of campus cells with the most recent incident activity, to focus patrols.
Flagged Zones	Mark and review risky areas (broken lights, dark corners, repeated trouble spots).
Safe Route	The same route planner students use — handy for escorting and advising.

Important: Keep your location sharing on while on duty. Dispatch assigns the **nearest on-duty officer** to SOS alerts, so an accurate position means faster response times for students.

Working a dispatch

1. Open **My Dispatches**. New jobs appear with status **pending** or **assigned**.
2. Accept the job and set your status to **en route** as you start moving. The student's SOS screen updates live with each change you make.
3. On arrival, set **on scene**. Assess, assist, and involve SAPS or medical services where needed.
4. When the situation is handled, set the dispatch to **resolved** and add a closing note.

Handling an incident report

1. Open the incident from the Security Map or from your dispatch list.
2. Review the description, the pinned location and any photo attachments the reporter uploaded.
3. Update the incident status (**Acknowledged** → **In Progress** → **Resolved**) as you work it. The reporter is notified automatically on every change.
4. Record what you found and what action was taken — this history is the audit trail.

Hotspots and flagged zones

The **Patrol Hotspots** page aggregates recent incidents into map cells so you can see where activity clusters. Spend visible patrol time there. Use **Flagged Zones** to mark hazards you notice in the field — a dead streetlight or an unlocked gate — so the whole team and the route planner know about them.

> **Tip:** The incident heat layer and the students' Safe Route planner read from the same data you maintain. Accurate statuses and flags directly improve the routing advice every student gets.
